

## Glutathione Injections

Glutathione, also referred to as L-Glutathione in injectable form, is an antioxidant injection designed to support cellular health, detoxification, immune function, and overall wellness. Glutathione is naturally produced by the body and plays an important role in helping protect cells from oxidative stress.

As we age, or during periods of increased stress, glutathione levels may decline. Glutathione injections can be used to support antioxidant activity, healthy detoxification pathways, immune system function, and cellular energy.

Glutathione injections may help support:

- **Antioxidant Defense** – Glutathione helps protect cells from oxidative stress caused by free radicals.
- **Cellular Health** – Glutathione plays an important role in maintaining healthy cell function and overall wellness.
- **Detoxification Support** – Glutathione supports the body's natural detoxification processes and helps aid in the elimination of toxins.
- **Immune Function** – Glutathione may help support a healthy immune response.
- **Energy & Wellness** – By supporting cellular function and helping address oxidative stress, glutathione may help promote overall energy and vitality.

### Suggested Dose

Use as directed. Typical use may start at 1 mL, with a maximum of 3 mL up to three times weekly, unless otherwise directed.

Dosage depends on the intent of treatment and the patient's response. Patients should follow their provider's instructions on how much and how often to utilize glutathione injections.

### How do I Administer Glutathione Injections?

Typically, glutathione injections may be administered as a subcutaneous or intramuscular injection, depending on provider guidance, dosage, and patient-specific needs.

Defy Medical allows patients to order glutathione vials, along with injection materials like needles and syringes, alcohol wipes, and sharps disposal containers. Our team also provides guidance on how to self-administer injections.

Patients local to Florida can visit the Defy Medical Tampa Clinic to have our trained staff administer their glutathione injection. They can receive additional wellness support from our customized IV infusions, as well.

### Combination Therapies:

Glutathione injections can be combined with other medications and supplements as appropriate under the supervision of a provider. The following products may be co-administered to support overall wellness:

- B12 Injections
- B-Complex Injections
- NAD+ Injections
- LIPO-C Injections
- Customized IV Infusions
